AfyaLink

Connecting communities to essential healthcare

A software engineering pitch deck

First draft • Power Learn Project (PLP)

Prepared by: [Your Full Name]

Getting basic healthcare can be difficult

People need clear information and practical ways to reach nearby services.

Information gaps

People may not know which clinic offers a service, when it is open, or what to bring.

Travel and time

Unnecessary trips can cost money and time, especially for families in underserved areas.

Communication barriers

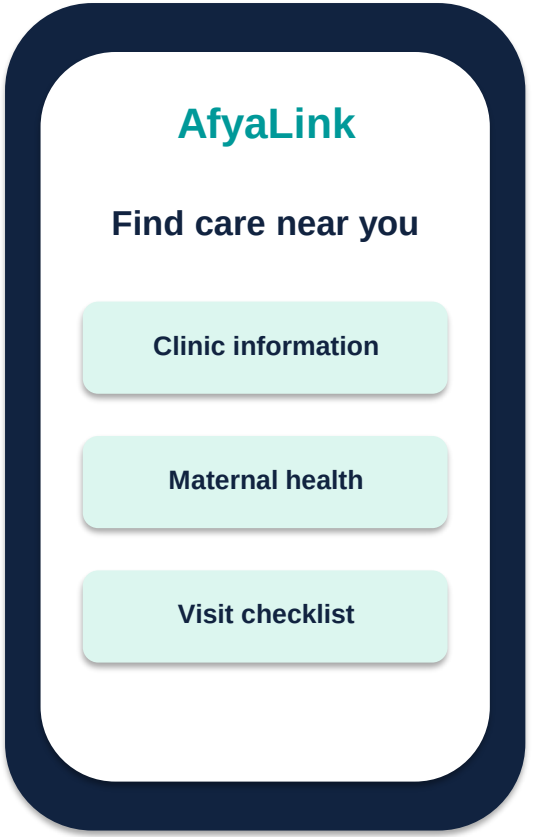

Language, literacy, and unreliable connectivity can make health information hard to use.

Opportunity: make trusted, local service information easier to find and understand.

AfyaLink: a simple digital health access tool

A mobile-friendly platform that helps users find services and prepare for visits.

- Search nearby health facilities and view verified service details.
- Read short health-service guides in accessible language.
- Save clinic information and visit checklists for offline use.
- Request a call-back or appointment where a partner facility supports it.
- Find referral contacts for urgent questions—without replacing clinical care.

Designed around real community needs

Start with one community and expand after testing with users.

Families and caregivers

People looking for clear, reliable information before visiting a facility.

Pregnant women and mothers

Users seeking maternal-health service details and visit preparation.

Community health workers

Trusted local workers who can share verified service information.

Primary launch audience: residents and community health workers in one pilot area.

Less confusion. Better preparation. Easier access.

The platform supports health access—it does not diagnose or replace professionals.

For users

- Clear service information
- Local language support
- Visit checklists and saved details

For clinics

- Fewer repetitive information requests
- Better-prepared visitors
- A simple channel for service updates

For partners

- Community outreach support
- Aggregated, privacy-conscious usage insights
- Easier referral information sharing

Core promise: trusted information that works on low-cost devices and limited connectivity.

A short, user-friendly journey

Keep the first version focused on the most important task.

1 → 2 → 3 → 4

1. Search

Choose location or service

2. Compare

Review verified facility details

3. Prepare

Save a checklist for the visit

4. Connect

Call or follow referral guidance

MVP (minimum viable product): service directory, language options, offline-saved details, and feedback.

Build a secure, lightweight, accessible product

Proposed technology stack for a student-built MVP; final choices depend on testing.

Frontend

HTML, CSS, JavaScript
Responsive design
Accessible forms and readable layouts

Backend & data

Python or Node.js API
PostgreSQL database
Role-based admin access

Delivery & quality

Progressive Web App approach
HTTPS and backups
Testing, monitoring, feedback

Engineering principles: privacy by design • low bandwidth • inclusive language • reliable data • maintainable code

Start small, prove value, then scale

This is a pilot hypothesis—not a claim of validated market size.

Pilot

One local area
A small set of verified facilities
Community feedback sessions

Expansion

More facilities and service categories
Additional local languages
Partnerships with health programmes

Long-term

A reusable platform for underserved areas
Potential integration with partner systems
Evidence-led growth

Next research step: interview users, clinic staff, and community health workers to validate the need.

Keep essential user access free

Explore partner-supported sustainability while protecting user trust.

NGO / programme partnerships

Partners may fund deployment, verified content, and community onboarding.

Facility support tools

Optional admin dashboard or service-update tools for participating facilities.

Grants and innovation funds

Seek early-stage support for user research, accessibility, hosting, and evaluation.

No user data sales. Any paid feature must be transparent, ethical, and agreed with partners.

Fit the solution to the local context

Validate alternatives during user research before making competitive claims.

Alternative	What it does well	Possible gap AfyaLink addresses
General web search	Broad information	Local, verified service details in one place
Phone calls / word of mouth	Familiar and personal	Consistent details that can be saved and shared
Clinic posters	Simple and offline	Updates and search across multiple services

Differentiator to test: local relevance + simple language + offline access + trusted updates.

Measure learning and real-world usefulness

Proposed first 90 days; timeline depends on partners and access.

Weeks 1–2	**Listen**	Interview users; map needs; confirm safeguards.
Weeks 3–5	**Prototype**	Design screens; test a clickable prototype.
Weeks 6–9	**Build MVP**	Develop core directory and offline-saving.
Weeks 10–12	**Pilot**	Test with users; fix issues; evaluate results.

Pilot metrics: successful service searches • information accuracy • user satisfaction • repeat use • accessibility issues resolved

Let’s make healthcare information easier to access.

What we need next

Pilot partners

Facilities and community health workers

User feedback

People who can test early designs

Technical support

Mentorship, hosting, and product review

Thank you
